

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

with a lesser Globe included, in order to make that inner Globe capable of being inhabited, there might not improbably be contained some luminous Medium between the Balls, fo as to make a perpetual Day below. That very great Tracts of the Etherial Space are occupied by such a shining Medium is evident from the Instances given in the first Paper of this Transaction: And if such a Medium should be thus inclosed within us; what should hinder but we may be allowed to suppose that some parts of this lucid Substance may, on very rare and extraordinary Occasions, transude through and penetrate the Cortex of our Earth, and being got loofe may afford the Matter whereof this our Meteor confists. This seems favoured by one considerable Circumstance, viz. that the Earth, because of its diurnal Rotation, being necessarily of the Figure of a Flat Spheroid, the thickness of the Cortex, in the Pelar Parts of the Globe, is confiderably less than towards the Equator; and therefore more likely to give Passage to these Vapours; whence a reason may be given why these Lights are always seen in the North. But I defire to lay no more stress upon this Conceit than it will bear.

It having been noted that in the Years 1575 and 1580, wherein this Appearance was frequent, that it was seen not far from the Times of the two Equinoxes; it may be worth while for the Curious, to bestow some Attention on the Heavens in the Months of September and October next; and in case it should again happen, to endeavour to observe, by the Method I have here laid down, what may determine, with some degree of Exactness, the Distance and Height thereof; without which we can scarce come to any just Conclusion.

FINIS.
